Mississippi Agricultural & Forestry Experiment Station

Robert H. Foglesong, President • Mississippi State University • Vance H. Watson, Vice President

NOTICE TO USER

This information bulletin is a summary of research conducted under project number MIS 2348 at seven locations in the state (see map). It is intended for farmers, seedsmen, colleagues, cooperators, and sponsors. Interpretation of this data should not be construed as a recommendation or as an endorsement of a specific variety or product.

This report contains data generated as part of the Mississippi Agricultural and Forestry Experiment Station research program. Joint sponsorship by the organizations listed on pages 76-79 is gratefully acknowledged.

Trade names of commercial products used in this report are included only for clarity and understanding. All available names (i.e., trade names, code numbers, chemical names, etc.) of varieties or products used in this research project are listed on pages 76-79.

Mississippi Soybean Variety Trials, 2006

Introduction

Procedures

There has been a proliferation of soybean varieties in recent years, and many good varieties are available to Mississippi producers. No single variety is superior, but in some situations, there are varieties that are more specifically adapted than others. Selecting a variety for planting requires knowledge of disease, nematode, and herbicide reactions, as well as the yield performance of each variety on a particular soil type. In many cases, planting the proper varieties will make substantial differences in yield and profitability on a farm. Proper management, including adequate lime, fertilizer, and weed control, is required to produce high yields of any variety, but yields may be limited, even under good management, unless the proper varieties are planted.

Soybean variety trials were conducted at six locations in 2006 (see map). Commercial seed companies were given the opportunity to enter varieties for testing. Seed of all private entries were supplied by the participating companies. Public varieties were selected by the Technical Advisory Committee for evaluation at each location. The experimental design at each location for each maturity group was a randomized complete block, with three replications of each entry.

Seeding Rate. All seeds were packaged for planting at the rate of nine seeds per foot of row for 30-inch row spacing and six seeds per foot of row for 18-inch row spacing. Plots were planted with a cone planter. Irrigated plots had four rows, spaced 30 inches apart; nonirrigated plots had three rows, spaced 18 inches apart. All plots were planted to a length of 20 feet. Plot ends were trimmed to a uniform length 3 to 4 weeks after emergence.

Cultural Practices. Cultural and pest control practices for optimum yields were followed. Plots were limed and fertilized on the basis of an annual soil test. All seeds were treated with Vitavax/Thiram plus Apron fungicides prior to planting. Only herbicides currently registered for use on soybeans with strict adherence to all label instructions were used in these studies.

Maturity Date. Maturity is considered to be the date when the pods are dry and most of the leaves have dropped. Under most conditions, the stems are also dry.

Yield. An Almaco SPC-20 plot combine was used to harvest each plot. Harvested seed were allowed to dry at ambient temperature to a uniform moisture content before weighing. Weights were converted to yield in bushels per acre (60 pounds per bushel).

Plant Height. Plants were measured from the soil to the top extremity, at maturity, and plant height was recorded as the average of the height of plants measured.

Lodging. Lodging was rated and recorded on a scale of 1-5: 1 = almost all plants erect; 2 = all plants leaning slightly or only a few plants down; 3 = all plants leaning moderately or 25 to 50 percent of plants down; 4 = all plants leaning considerably or 50 to 80 percent of plants down; and 5 = all plants down.

Disease and Nematodes. When a disease or nematode problem is correctly identified, the information in Tables 70 to 80 may be used to select varieties that have genetically inherited resistance to the problem. Stem canker ratings shown in this report were determined by Dr. Gabe Sciumbato, MAFES plant pathologist.

How to Select Varieties

In Problem or Difficult Fields

(1) Identify fields that have had problems in the past. Problems to consider may include diseases, nematodes, or fields that make planting or harvest difficult because of extremely dry or wet conditions. The Mississippi State University Extension Service offers a disease diagnostic service and nematode analysis free of charge.

(2) Use Tables 70 to 80 to select varieties for fields that need nematode or other pest resistance.

(3) Select varieties using multiyear averages from all available locations. Identify those varieties that have desired pest resistance along with a high yield potential. Use data from a test site or sites with a soil type similar to that where the soybeans will be grown. Consider planting dates and maturity dates that may allow you to avoid historical field problems.

In Nonproblem Fields

(1) Identify the farm's highest yielding fields that have no specific disease problems.

(2) Select varieties with the best yield potential using multiyear averages from all available locations. Use data from a test site or sites with a soil type similar to that where the soybeans will be grown.

(3) Try new varieties on a limited number of acres. Don't abandon older, consistent-performing varieties that are yielding well unless research and experience show an advantage for newer varieties.

Planting Date and Maturity Date

(1) Varieties in Maturity Groups III, IV, and V are recommended. Earlier maturing varieties should be considered for planting where fall seedbed preparation was done the previous year and in fields that are subject to drought stress during the growing season and/or wet soils during the usual harvest period. Later maturing varieties should be considered for planting in fields that are not as prone to drought stress, where irrigation will be used to alleviate drought stress and for later planting. However,

early planting of all acreage is encouraged to reduce risk from drought and obtain higher yields.

(2) Early-season production is a practice that has been quite successful and consistent for several years. Cool, wet soils at planting may justify the use of a seed treatment that has activity against *Pythium*, since no varieties have resistance to infection and resulting damage from this organism. Most Maturity Group IV soybeans have a narrow growth habit. Given their growth habit, narrow rows are quite advantageous. Early April to early May planting is recommended for early-season production of Group IV varieties. Irrigation allows later planting of early maturing soybeans; however, the full yield potential may not be realized when planted late. Timely harvest is crucial with early-maturing varieties, because dry weather at maturity may promote shattering. There is a wide range in maturity within Group IV soybeans. Determine if an early Group IV or a late Group IV variety, or some acreage of both, will fit into your operation.

(3) Timely planting is crucial for optimum production of all maturity groups of soybeans. An attempt should be made to complete soybean planting as early as possible. Planting of Group V and Group VI can be made in April. Delays in planting will result in reduced yield potential for almost all varieties in all maturity groups.

Herbicide-Resistant Varieties

(1) Evaluate overall performance characteristics of the variety — including yield potential, disease and nematode resistance, maturity date, lodging, etc. — as you would any variety.

(2) Compare these characteristics to other varieties, conventional and herbicide-resistant.

(3) Consider seed premiums, technology fees, and specific weed problems. Determine total cost of conventional and herbicide-resistant-crop weed control programs, and combine this information with factors listed in this section when choosing a variety.

General Characteristics of Varieties

Soybean varieties differ in significant characteristics that may not affect their performance. Tables 62 to 69 give the general characteristics of most varieties grown in Mississippi.

Pubescence and Hilum Color. Brown (tawny) and gray are the basic pubescence (hair) colors found among varieties. Varying pod-wall colors result in different intensities of mature pod colors. The "eye" of the seed is called a hilum, or point of attachment to the pod, and it differs in color by variety.

Seed Size. There is no relationship between inherited seed size and seed yield. A small-seeded variety may yield as much as or more than a large-seeded variety. The average seed per pound for different varieties is shown in Tables 62 to 69, but this is subject to seasonal variation. Knowing the number of seed per pound is important in determining the amount of seed needed for planting. Fewer pounds are required for small-seeded varieties than for large-seeded varieties. Your county Extension office has a publication

(Information Sheet 1194) that deals with seeding rates and plant populations.

Flowering. Varieties of Group IV maturity generally display an indeterminate growth habit. This means that a large portion of their vegetative growth occurs after the onset of flowering begins. In contrast, varieties of Groups V and VI display a determinate growth habit, where most of the vegetative growth occurs before flowering. The date of first flower will be determined by the time of planting and maturity. For example, a mid-Group IV variety may bloom 3 weeks earlier than a Group V variety, whereas a late Group IV variety may bloom only 1 week earlier than a Group V variety. Soybean flower petals are purple or white. The flower color is controlled strictly by genetics, and only one flower color occurs in a pure variety.

Within the Group IV maturity group trials, the wide variation in maturity dates is attributed to lack of rigid standards for classifying varieties within a group. It was decided to subdivide both the Group IV and

Group V trials into two maturity groups. All maturity groups were assigned an early and late-maturity check:

Conventional Test

Maturity Group	Early Check	Late Check
Group IV Early	–	DP4748S
Group IV Late	DP4748S	DP5110S
Group V Early	DP5110S	USG5601T
Group V Late	USG5601T	–

Roundup Ready Test

Maturity Group	Early Check	Late Check
Group IV Early	–	DP4546
Group IV Late	DP4546	P94M80
Group V Early	P94M80	DP5915
Group V Late	DP5915	–

Use of Data Tables and Summary Statistics

The yield potential of a given variety cannot be measured with complete accuracy. Consequently, replicated plots of all varieties are evaluated for yield, and the yield of a given variety is estimated as the mean of all replicated plots of that variety. Yields may vary from one plot to another, which introduces a certain degree of error to the estimation of yield potential. This natural variation is often responsible for yield differences seen among different varieties. Thus, even if the mean yield of two varieties are numerically different, they are not necessarily significantly different in terms of yield potential. In other words, the ability to measure yield is not precise enough to determine whether such small differences are observed purely by chance or because of superior performance.

The least significant difference (LSD) is an estimate of the smallest difference between two varieties that can be declared to be the result of something other than random variation in a particular trial. Consider the following example for a given trial:

Variety	Yield
Abe	40 bu/A
Bill	35 bu/A
Charlie	31 bu/A
LSD	7 bu/A

The difference between variety Abe and variety Bill is 5 bushels per acre ($40 - 35 = 5$). This difference is **smaller** than the LSD (7 bushels per acre). Consequently, it is concluded that variety Abe and variety Bill have the

same yield potential, since the observed difference occurred purely due to chance.

The difference between variety Abe and variety Charlie is 9 bushels per acre ($40 - 31 = 9$), which is **larger** than the LSD (7 bushels per acre). Therefore, it is concluded that the yield potential of variety Abe is superior to that of variety Charlie, since the difference is larger than would be expected purely by chance.

The coefficient of variation (CV) is a measure of the relative precision of a given trial and is used to compare the relative precision of different trials. The CV is generally considered to be an estimate of the amount of unexplained variation in a given trial. This unexplained variation can be the result of variation between plots, with respect to soil type, fertility, insects, diseases, drought stress, etc. In general, the higher the CV, the less precise a given trial is.

The coefficient of determination (R^2) is another measure of the level of precision in a trial and is also used to compare the relative precision of different trials. The R^2 is a measure of the amount of variation that is explained, or accounted for, in a given trial. For example, an R^2 value of 90 percent indicates that 90 percent of the observed variation in the trial has been accounted for in the trial, with the remaining 10 percent being unaccounted for. The higher the R^2 value, the more precise the trial. The R^2 is generally considered to be a better measure of precision than is the CV, for comparison of different trials.

Location 1. MAFES Delta Branch, Stoneville

Location Summary

The nonirrigated trials were planted into a fall prepared seedbed containing good soil moisture. After the stand emerged, heavy rainfall fell in late April. Good field drainage prevented any stand losses. The remainder of the growing season had warmer-than-normal temperatures and below-normal rainfall. As a result of these

weather conditions, soybean yields were lower than expected. The irrigated trials were planted into similar soil conditions as the nonirrigated trials. However, the heavy rainfall in late April did reduce stand to some degree in some plots. The hot, dry growing season was offset by timely irrigation and yields were outstanding.

Soil type	Sharkey clay
Soil pH	7.3
Soil fertility	P=H; K=H
Fertilizer added	None
Herbicide application	Nonirrigated: Postemergence — Roundup Weathermax @ 22 oz/A on 5-18-06 and 6-18-06 Irrigated: Roundup Ready Test — Preemergence – Scepter @ 2.86 oz/A + Dual II Magnum @ 32 oz/A on 4-18-06 Postemergence – Roundup Weathermax @ 22 oz/A on 5-18-06 Lay-By – Roundup Weathermax @ 22 oz/A + Classic @ 0.25 oz/A on 6-23-06 Irrigated: Conventional Test — Preemergence – Scepter @ 2.86 oz/A + Dual II Magnum @ 32 oz/A on 4-18-06 Postemergence – Classic @ 0.5 oz/A + Basagran @ 1.5 pt/A on 5-18-06 Lay-By – Reflex @ 1 pt/A + Select @ 10 oz/A + Dual II Magnum @ 1 pt/A on 6-23-06
Insecticide	None
Irrigation	June 7, June 13, July 6, July 14, July 28, August 8, August 23, and September 7 (Group 5 only)
Planting date	Nonirrigated – April 17; Irrigated – April 18
Harvest date	Group III – August 8; Group IV E NI – August 16; Group IV L NI – August 21; Group IV E Irrigated – September 8; Group IV Conventional – September 21; Group IV L Irrigated – September 21; Group V Conv. and RR – October 12

¹Sharkey clay soil. (E) = Experimental.

Location 2. Dulaney Farms, Inc., Clarksdale (Irrigated)

Location Summary

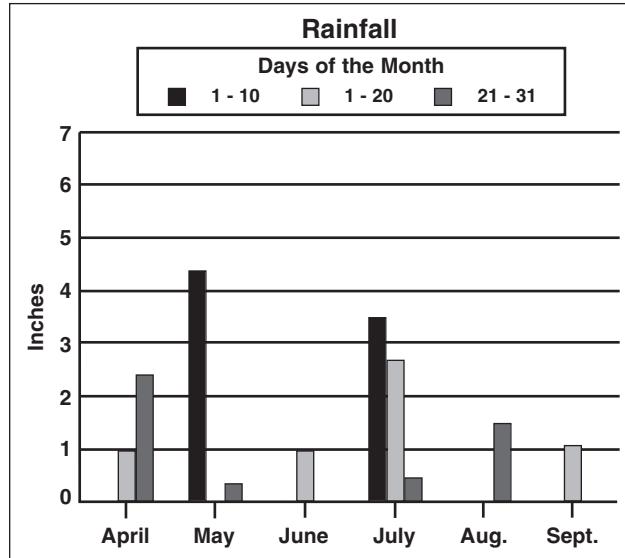

Soybeans were planted into a crusted seedbed with good moisture and emerged to a good stand after rainfall. The growing season brought warmer and drier-than-nor-

mal temperatures and rainfall. Even with irrigation, soybean yields were lower than historically expected for this location.

Soil type	Sharkey clay
Soil pH	6.8
Soil fertility	P=H; K=H
Fertilizer added	None
Herbicide application	Preemergence — Dual II Magnum @ 32 oz/A on 4-19-06 Postemergence — Roundup Weathermax @ 22 oz/A on 5-17-06 Lay-By — Sequence @ 3 pt/A on 6-27-06
Insecticide/Fungicide	Headline @ 4 oz/A + Karate Z @ 1.6 oz/A on 7-25-06 Orthene @ 0.6 lb/A on 8-30-06
Irrigation	June 14, June 24, July 5, July 15, July 25, and August 7.
Planting date	April 19
Harvest date	Group IV E RR — September 11; Group IV L RR — September 29; Group V E and L RR — October 6

Rainfall Summary

	Inches
April	3.40
May	4.80
June	1.50
July	0.30
August	1.50
September	1.10
Total	12.60

¹Sharkey clay soil. (E) = Experimental.

Location 2. Mattson Farms, Clarksdale (Nonirrigated)

Location Summary

Soybeans were planted no-till into good soil moisture and emerged to a good stand. The above-average temper-

atures and below-average rainfall reduced soybean yields. Harvest was completed in hot, dry weather conditions.

Soil type	Sharkey clay
Soil pH	6.7
Soil fertility	P=H; K=H
Fertilizer added	None
Herbicide application	Preemergence — Dual II Magnum @ 32 oz/A on 4-12-06 Postemergence — Roundup Weathermax @ 22 oz/A on 5-17-06
Planting date	April 12
Harvest date	Group III — August 8; Group IV E — August 8; Group IV L — August 15

Rainfall Summary

	Inches
April	3.40
May	4.80
June	1.50
July	0.30
August	1.50
September	1.10
Total	12.60

¹Sharkey clay soil. (E) = Experimental.

Location 3. Todd Williams Farm, Olive Branch

Location Summary

The soybean test was planted after a field cultivator was pulled over the field. Soil moisture was ideal, and a good stand was established. Even with the hot, dry grow-

ing season, rainfall in August was adequate enough to produce good yields. Insect and disease pressure were light. Harvest was completed on time.

Soil type	Collins silt loam
Soil pH	6.1
Soil fertility	P=H; K=H+
Fertilizer added	P ₂ O ₅ @ 30 lb/A + K ₂ O @ 90 lb/A + B @ 1 lb/A
Herbicide application	Preemergence — Dual II Magnum @ 24 oz/A on 4-13-06 Postemergence — Roundup Weathermax @ 22 oz/A + First Rate @ 0.15 oz/A on 5-22-06 and 6-05-06 Lay-By — Roundup Weathermax @ 22 oz/A + Pursuit @ 1.44 oz/A on 6-15-06
Planting date	April 13
Harvest date	Group III — September 1; Group IV RR — September 21; Group V RR — October 3

Rainfall Summary

	Inches
April	3.68
May	3.61
June	1.57
July	1.04
August	2.60
September	2.65
October	1.01
Total	16.16

Location 4. Gibb Steele Farms, Longwood

Location Summary

Soybeans were planted no-till into rice stubble and came up to a good stand. The growing season consisted of below-normal rainfall and above-normal temperatures. There was no rainfall recorded in the month of July. With

irrigation, soybean yields were good. Harvest of the Maturity Group IV soybeans was delayed by a late irrigation and rainfall. The Maturity Group V soybeans were harvested on time.

Soil type	Sharkey clay
Soil pH	7.4
Soil fertility	P=M+; K=M+
Fertilizer added	None
Herbicide application	Roundup Ready Test — Preemergence — Roundup Weathermax @ 22 oz/A + Dual II Magnum @ 32 oz/A + Scepter @ 2.86 oz/A on 4-16-06 Postemergence — Roundup Weathermax @ 22 oz/A on 5-18-06 Postemergence — Roundup Weathermax @ 22 oz/A + Reflex 2 12 oz/A on 6-8-06 Lay-By — Roundup Weathermax @ 22 oz/A + Pursuit @ 1.44 oz/A on 6-30-06 Conventional Test — Preemergence — Roundup Weathermax @ 22 oz/A + Dual II Magnum @ 32 oz/A + Scepter @ 2.86 oz/A on 4-16-06 Postemergence — Classic @ 0.75 oz/A + Select @ 10 oz/A on 5-18-06 Postemergence — Reflex @ 24 oz/A + Select @ 10 oz/A on 6-8-06 Lay-By — Classic @ 0.66 oz/A + First Rate @ 0.15 oz/A + Select @ 10 oz/A on 6-30-06

¹Sharkey clay soil. (E) = Experimental.

Location 6. Ballground Plantation, Warren County

Location Summary

After the plot area was disked and do-alled, soybeans were planted into good soil moisture and emerged to a good stand. Although the growing season was warmer

and drier than normal, timely rainfall produced good yields. There was some delay, due to rainfall, in harvesting.

Soil type	Loring silt loam
Soil pH	6.5
Soil fertility	P=M; K=M
Fertilizer added	None
Herbicide application	Preemergence — Dual II Magnum @ 24 oz/A on 4-11-06 Postemergence — Roundup Weathermax @ 22 oz/A on 5-16-06 and 6-6-06 Lay-By — Sequence @ 3 pt/A on 6-16-06
Insecticide application	None
Planting date	April 11
Harvest date	Group IV E — August 14; Group IV L — August 28; Group V — October 12

Rainfall Summary

	Inches
April	2.10
May	2.60
June	2.20
July	4.4
August	0.60
September	5.7
Total	17.60

Reaction to Diseases

Tables in this section report data on the soybean varieties' reactions to the common disease stem canker.

Disease Ratings. Disease rating for stem canker were made by plant pathologists at Mississippi State University.

Stem Canker Score. In addition to the disease ratings, each variety was also assigned a score for its reaction to stem canker. This score gives an average rating of 40 plants stuck with a toothpick of stem canker inoculum. Stem canker ratings convey the level of tolerance based on the score of the plants tooth picked: VS = 4.6-5.0; S =

2.0-4.5; MS = 1.5-1.9; MR = 1.2-1.4; R = 1.0-1.1. Some lines or varieties exhibited a range of reactions to stem canker. These findings are expressed as ranges in the table (i.e., R-VS). In these ranges, letters in parentheses highlight a variety's predominant reaction. For example, "R-VS(R)" means the variety ranged from resistant to very susceptible in its response; however, the predominant response was resistant. Varieties or lines that exhibited such a range were mixtures or were still segregating.

HNR is the highest numeric rating in response to stem canker.

In-Field Disease Ratings and Observations

Tables 75-80 contain data on soybean varieties' reactions to late-season Cercospora, Green Stems, and Shattering.

John Hicks, retired soybean breeder, collected this data from Mississippi soybean variety trials at Ballground, Longwood, and Stoneville.

Late-Season Cercospora. This disease is rated on a 1-9 scale: 1 = no or very little disease, and 9 = severe leaf discoloration and defoliation.

Green Stems. This disease is rated on a 1-9 scale when pods are dry and ready to harvest: 1 = no green stem, 3 = 33% of plants have green stem, 5 = all plants have green stems with some green petioles, 7 = all plants have green stems retaining 33% of green leaves, and 9 = all plants have green stems retaining 100% of green leaves.

Shattering. This disease is rated on a 1-9 scale: 1 = little to no shattering, and 9 = all seed shattered out.
